

PNA Renal Pathology Workshop

This workshop will provide access to over 30 real cases of pediatric diseases and their corresponding renal biopsy findings. The material consists of scanned glass slides that can be viewed digitally, and selected jpeg images representing relevant immunofluorescence and electron microscopy findings. The cases span a broad spectrum of neonatal and childhood diseases, both hereditary and acquired, including glomerular, vascular and tubule-interstitial common and extraordinary entities. Anonymized actual pathology reports, a detailed comment describing the salient features and the differential diagnosis and or references supporting the diagnoses will be included. Twenty-five computers will be housed in a separate computer room stuffed with instructors.

This unique material will be available for viewing Tuesday through Thursday September 21-23, 2016. Inquire onsite for the exact location of the workshop.

This is the first ever, pediatric renal pathology workshop organized by top experts in the field, to be offered anywhere in the world. The pathology material was provided by the IPNA renal pathology course faculty, with the support for the digital scanning and uploading by the International Summer School of Renal Pathology (www.issrp.com) and the rental of computers supported by Arkana Laboratories (www.arkanlabs.com)
